

Danger Level 3 - Considerable

Tendency: Decreasing avalanche danger
on Saturday 25 02 2023

Wind slab

2000m

Snowpack stability: **very poor**

Frequency: **many**

Avalanche size: **medium**

New snow

1800m

Snowpack stability: **very poor**

Frequency: **many**

Avalanche size: **medium**

Fresh snow and large quantities of wind-drifted snow represent the main danger.

The fresh snow as well as the wind slabs that are being formed by the southerly wind must be evaluated with care and prudence in particular on steep shady slopes and at intermediate and high altitudes. Dry avalanches can over a wide area be released very easily or triggered naturally. In particular on wind-protected shady slopes they can be triggered in the faceted old snow and reach medium size. In these regions the avalanche prone locations are more prevalent and the danger is greater.

Snowpack

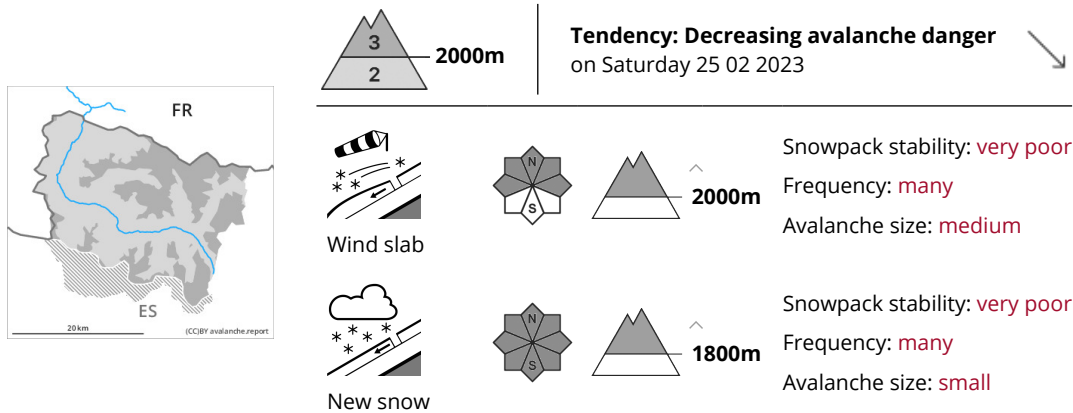

20 to 30 cm of snow, and up to 40 cm in some localities, will fall until Friday above approximately 2000 m. The wind will be strong to storm force in some localities. The wind will transport the new snow significantly. The new snow and wind slabs will be deposited on the unfavourable surface of an old snowpack in particular on wind-protected shady slopes and at intermediate and high altitudes. They will become increasingly prone to triggering. On Friday it will be sunny.

In high Alpine regions snow depths vary greatly, depending on the influence of the wind. At intermediate and high altitudes there are 50 to 120 cm of snow, and even more in some localities.

Tendency

Saturday: Temporary decrease in danger of dry avalanches as the snowfall eases.

Danger Level 3 - Considerable

Fresh snow and large quantities of wind-drifted snow represent the main danger.

The fresh snow and in particular the wind slabs that are being formed by the southerly wind must be evaluated with care and prudence in particular on steep shady slopes and at intermediate and high altitudes. Dry avalanches can in many places be released very easily or triggered naturally. In particular on wind-protected shady slopes they can be triggered in the faceted old snow and reach medium size. In particular in regions exposed to heavier precipitation the avalanche prone locations are more prevalent and the danger is greater.

Snowpack

10 to 20 cm of snow, and up to 40 cm in some localities, will fall until Friday above approximately 2000 m. The wind will be strong to storm force in some localities. The southerly wind will transport the new snow significantly. The new snow and wind slabs will be deposited on the unfavourable surface of an old snowpack in particular on wind-protected shady slopes and at intermediate and high altitudes.
