

Danger Level 1 - Low

Tendency: Constant avalanche danger →
on Friday 02 02 2024

The avalanche conditions are mostly favourable. Gliding avalanches are possible now only in isolated cases.

Extremely steep grassy slopes and steep terrain that is interspersed with rocks: A latent danger of gliding avalanches exists. The avalanches are rather small. As the temperature drops hardly any more moist snow slides are possible as the day progresses.

Snowpack

Sunny slopes: The surface of the snowpack will freeze to form a strong crust and will soften later than the day before.

Shady slopes: As a consequence of falling temperatures and low relative humidity the snowpack became faceted during the last few days and has therefore lost strength. It is largely stable and its surface consists of loosely bonded snow lying on a resilient crust.

Above approximately 2000 m there are 40 to 50 cm of snow, and even more in some localities. At low altitude from a snow sport perspective, insufficient snow is lying.

Tendency

Friday: The avalanche danger will persist.
