

Danger Level 1 - Low

Tendency: Constant avalanche danger →

on Monday 05 02 2024

Wet snow

1800m

Snowpack stability: **poor**

Frequency: **few**

Avalanche size: **small**

The avalanche conditions are mostly favourable. Gliding avalanches and moist loose snow slides are possible from the middle of the day in isolated cases.

As a consequence of warming during the day and the solar radiation, the likelihood of moist snow slides being released will increase for a while in particular on very steep sunny slopes at intermediate and high altitudes. Extremely steep grassy slopes and steep terrain that is interspersed with rocks: A latent danger of gliding avalanches exists. The avalanches are rather small.

Snowpack

Sunny slopes: The surface of the snowpack will freeze to form a strong crust and will soften earlier than the day before.

Shady slopes: Towards its surface, the snowpack is faceted and its surface consists of loosely bonded snow lying on a resilient crust.

Above approximately 2000 m there are 40 to 50 cm of snow, and even more in some localities. At low altitude from a snow sport perspective, insufficient snow is lying.

Tendency

Monday: The danger of gliding avalanches and moist snow slides will persist.
