

## Danger Level 3 - Considerable

### New snow and wind slabs require caution.

The new snow can be released easily, even by a single winter sport participant in all aspects above approximately 1500 m. Sometimes the avalanches are medium-sized and in many cases easily released. As a consequence of warming during the day and the solar radiation, the likelihood of moist avalanches being released will increase appreciably on very steep sunny slopes.

The sometimes deep wind slabs can be released easily. or in isolated cases naturally, in particular on steep shady slopes. The avalanche prone locations are to be found especially adjacent to ridgelines and in gullies and bowls, and behind abrupt changes in the terrain.

Defensive route selection is required.

### Snowpack

15 to 20 cm of snow, and even more in some localities, has fallen above approximately 1800 m. In some regions 5 cm of snow will fall until the evening above approximately 1500 m. The southerly wind has transported the new snow.

The solar radiation will give rise from early morning to increasing moistening of the snowpack on sunny slopes. The new snow and wind slabs have bonded well with the old snowpack in all aspects.

### Tendency

Thursday: Gradual increase in danger of dry avalanches as a consequence of the precipitation.
