

Danger Level 3 - Considerable

Tendency: Constant avalanche danger →
on Sunday 31 03 2024

Wind slab

Snowpack stability: **very poor**

Frequency: **some**

Avalanche size: **medium**

New snow

Snowpack stability: **very poor**

Frequency: **some**

Avalanche size: **medium**

New snow and wind slabs require caution.

The fresh and somewhat older wind slabs can be released easily, or in isolated cases naturally, in particular on shady slopes and at high altitudes and in high Alpine regions. Sometimes the avalanches are medium-sized. The avalanche prone locations are to be found especially adjacent to ridgelines above approximately 2400 m and in gullies and bowls, and behind abrupt changes in the terrain. These places are covered with new snow and are therefore difficult to recognise.

As a consequence of the snowfall, the likelihood of dry avalanches being released will increase a little in all aspects above approximately 1800 m. Sometimes the avalanches in these regions are medium-sized and in many cases easily released.

Backcountry touring and other off-piste activities call for careful route selection.

Snowpack

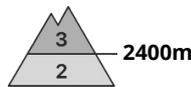

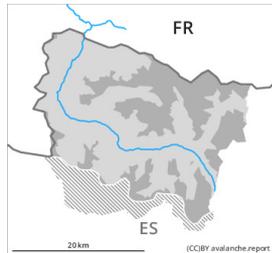

20 to 40 cm of snow, and even more in some localities, fell during the night. The southerly wind has transported the fresh and old snow.

The new snow and wind slabs have bonded well with the old snowpack in all aspects. Above approximately 1800 m there are 60 to 100 cm of snow, and even more in some localities. At high altitudes and in high Alpine regions snow depths vary greatly, depending on the influence of the wind.

Tendency

Sunday: Slight increase in danger of dry avalanches as a consequence of new snow and wind.

Danger Level 3 - Considerable

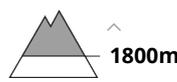

Tendency: Constant avalanche danger →
on Sunday 31 03 2024

Snowpack stability: **very poor**

Frequency: **some**

Avalanche size: **medium**

Snowpack stability: **very poor**

Frequency: **some**

Avalanche size: **small**

New snow and wind slabs require caution.

The wind slabs can be released by a single winter sport participant in particular on steep shady slopes. The avalanches are rather small. The avalanche prone locations are to be found especially adjacent to ridgelines above approximately 2400 m. They are sometimes covered with new snow and are therefore difficult to recognise.

As a consequence of the new snow dry and moist avalanches are to be expected as the day progresses, even medium-sized ones. These can be released by people or triggered naturally.

Defensive route selection is important.

Snowpack

10 to 20 cm of snow, and even more in some localities, fell during the night above approximately 1800 m.

The southerly wind has transported the fresh and old snow.

The new snow and wind slabs have bonded well with the old snowpack in all aspects. Above approximately 2000 m there are 40 to 80 cm of snow, and even more in some localities. On sunny slopes as well as at low altitude from a snow sport perspective, insufficient snow is lying.

Tendency

Sunday: Slight increase in danger of dry avalanches as a consequence of the snowfall.
