

Danger Level 2 - Moderate

Tendency: Decreasing avalanche danger
on Tuesday 09 04 2024

Wet snow

Snowpack stability: **very poor**

Frequency: **few**

Avalanche size: **medium**

Wet snow represents the main danger.

As the day progresses an unfavourable avalanche situation will persist in some regions. As the moisture increases more moist snow slides and avalanches are possible, even medium-sized ones. Avalanches can be released by people or triggered naturally. In particular at the border to Benasque and at the border to Ribagorça and Pallars the avalanche prone locations are more prevalent and the danger is greater. In addition a latent danger of gliding avalanches exists.

The current avalanche situation calls for restraint.

Snowpack

The avalanche conditions remain spring-like. Outgoing longwave radiation during the night will be reduced. The sleet will give rise towards the evening to rapid and thorough wetting of the snowpack in some cases in all aspects also at elevated altitudes. The southerly foehn wind will transport only a little snow. Above approximately 2000 m there are 20 to 100 cm of snow, and even more in some localities. At high altitudes and in high Alpine regions snow depths vary greatly, depending on the influence of the wind.

Tendency

Some snow will fall on Tuesday over a wide area. Gradual increase in danger of dry avalanches as a consequence of new snow and wind. Sharp decrease in danger of moist avalanches as the temperature drops.
