

## Danger Level 2 - Moderate

**Tendency: Increasing avalanche danger**

on Wednesday 23 April 2025

Wind slab

2200m

Snowpack stability: **poor**

Frequency: **some**

Avalanche size: **medium**

Wet snow

1900m

Snowpack stability: **very poor**

Frequency: **few**

Avalanche size: **medium**

Wind slabs and wet snow require caution. Especially in the valleys bordering the Ribagorçana basin and the Pallaresa basin the avalanche prone locations are more prevalent.

As a consequence of new snow and wind from southerly directions, wind slabs formed in particular adjacent to ridgelines and in pass areas as well as at elevated altitudes. They are to be found in particular on northwest, north and east facing slopes. In many cases the avalanches are medium-sized and can be released by a single winter sport participant.

At the border to Ribagorça and Pallars the avalanche prone locations are more prevalent and the danger is slightly greater. Large avalanches are still not ruled out.

Especially on steep sunny slopes and at low and intermediate altitudes hardly any more small and medium-sized moist snow slides and avalanches are to be expected as a consequence of warming during the day. Gliding avalanches can also occur.

Backcountry touring calls for experience in the assessment of avalanche danger.

### Snowpack

The weather will be very cloudy over a wide area. Some snow will fall from midday. The wind will be light to moderate adjacent to ridgelines.

The surface of the snowpack will freeze very little and will already soften in the late morning. At low altitude no snow is lying.

### Tendency

Significant increase in danger of moist avalanches as a consequence of warming during the day and solar radiation. Gradual decrease in danger of dry avalanches.
