

## Danger Level 2 - Moderate

**Tendency: Increasing avalanche danger**   
on Thursday 24 April 2025

Wet snow

Snowpack stability: **very poor**

Frequency: **few**

Avalanche size: **medium**

Wind slab

Snowpack stability: **poor**

Frequency: **few**

Avalanche size: **small**

Wet snow represents the main danger. Wind slabs in the high Alpine regions. Especially in the valleys bordering the Ribagorçana basin and the Pallaresa basin the avalanche prone locations are more prevalent.

Especially on steep sunny slopes more small and medium-sized moist snow slides and avalanches are to be expected as a consequence of warming during the day. Avalanches can release the saturated snowpack and reach medium size.

The older wind slabs can be released by a single winter sport participant in some cases in particular on very steep shady slopes in high Alpine regions. They are to be found in particular on northwest, north and east facing slopes. At the border to Ribagorça and Pallars the avalanche prone locations are more prevalent and the danger is slightly greater. In isolated cases the avalanches in these regions are medium-sized.

The Avalanche Warning Service currently has only a small amount of information about the snowpack, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

### Snowpack

The weather will be partly cloudy over a wide area. The wind will be light to moderate adjacent to ridgelines.

The surface of the snowpack will freeze very little and will already soften in the late morning. Sunshine and high temperatures will give rise as the day progresses to increasing moistening of the snowpack. At low altitude no snow is lying.

### Tendency

Significant increase in danger of moist avalanches as a consequence of warming during the day and solar radiation. In particular adjacent to ridgelines: Further increase in danger of dry avalanches as a consequence of the moderate to strong northwesterly wind.
