Danger Level 3 - Considerable

3 / 2 2200m

Tendency: Constant avalanche danger
on Friday 26 December 2025 →

Wind slab — 2200m
Snowpack stability: poor
Frequency: many
Avalanche size: medium

New snow — 1800m
Snowpack stability: poor
Frequency: some
Avalanche size: small

Persistent weak layer — 2200m
Snowpack stability: poor
Frequency: some
Avalanche size: medium

New snow, wind slabs and old snow are to be assessed with care and prudence.

The cold fresh snow and all the wind slabs must be evaluated with care and prudence in all aspects. This snow is lying on top of a weakly bonded old snowpack in particular on shady slopes. Fresh and somewhat older wind slabs are sometimes deep and prone to triggering. As a consequence of new snow and a moderate southeasterly wind, further wind slabs will form by Boxing Day in particular on north and west facing slopes. Sometimes dry avalanches are medium-sized. In particular in regions exposed to heavier precipitation the avalanche prone locations are more prevalent and the danger is greater.

Ski touring and other off-piste activities, including snowshoe hiking, call for extensive experience in the assessment of avalanche danger and restraint.

Snowpack

Over a wide area 30 cm of snow, and even more in some localities, has fallen since Sunday above approximately 1500 m. Sunny slopes low and intermediate altitudes: As a consequence of mild temperatures and solar radiation the snowpack settled until the middle of the day. Shady slopes intermediate and high altitudes: The new snow and wind slabs are poorly bonded with the old snowpack. Released avalanches and field observations confirm this situation.

Christmas Day: Some snow will fall in particular in the east and in the south. The southeasterly wind will transport the new snow.

At intermediate altitudes there are 50 to 100 cm of snow, and even more in some localities. At elevated altitudes snow depths vary greatly, depending on the infuence of the wind.

Tendency

Boxing Day: As a consequence of new snow and wind, further wind slabs will form. The danger of dry avalanches will not decrease for the time being.
