

Danger Level 2 - Moderate

Tendency: Decreasing avalanche danger
on Monday 18 04 2022

Gliding snow

Wet snow

Wet and gliding snow represent the main danger.

As a consequence of warming during the day and solar radiation more wet and gliding avalanches are possible as the day progresses.

The avalanche prone locations for gliding avalanches are to be found on very steep east, south and west facing slopes in all altitude zones and on shady slopes below approximately 2400 m. In very isolated cases the avalanches in these locations are large.

In addition as the day progresses in all aspects, numerous small and, in isolated cases, medium-sized wet snow slides and avalanches are to be expected. Moist avalanches can be released by people or triggered naturally.

Snowpack

The conditions are spring-like.

The surface of the snowpack is frozen, but not to a significant depth and will already soften in the late morning.

The meteorological conditions caused a substantial weakening of the snowpack in all aspects. Naturally triggered avalanches confirm a dangerous avalanche situation.

Tendency

Gradual decrease in danger of wet and gliding avalanches as the temperature drops.
