

Danger Level 2 - Moderate

Tendency: Constant avalanche danger →
on Saturday 17 12 2022

New snow

Snowpack stability: **poor**
Frequency: **some**
Avalanche size: **small**

Wind slab

Snowpack stability: **poor**
Frequency: **some**
Avalanche size: **medium**

New snow and wind slabs require caution.

Error: Línia desconeguda 552 en im_Gebiet!

Snowpack

Outgoing longwave radiation during the night was barely evident. Above approximately 1800 m snow will fall until the evening. In particular in the west up to 5 cm of snow, and up to 10 cm in some localities, will fall.

The more recent wind slabs are bonding poorly with the old snowpack in particular on wind-protected shady slopes above approximately 2200 m.

In all regions there are 40 to 60 cm of snow, and even more in some localities. At high altitudes and in high Alpine regions snow depths vary greatly, depending on the influence of the wind.

Tendency

Friday: Gradual decrease in avalanche danger as a consequence of solar radiation.
