Wind slab

Snowpack stability: **very poor**

Frequency: **some**

Avalanche size: **large**

New snow

Snowpack stability: **very poor**

Frequency: **some**

Avalanche size: **medium**

New snow and wind slabs in all altitude zones. Outside marked and open pistes a very critical avalanche situation will prevail.

The large quantity of fresh snow and in particular the often large wind slabs can be released easily or naturally. The avalanches are large and easily released.

Danger level 4 (high) will be reached during the second half of the night above approximately 2000 m. As a consequence of the ceasing of precipitation there will be a gradual decrease in the avalanche danger to level 3 (considerable) as the day progresses.

The avalanche prone locations are to be found on east to south to west facing aspects and in shady places that are protected from the wind in all altitude zones.

Ski touring, freeriding and snowshoe hiking are to be restricted to flat or controlled terrain.

Snowpack

As a consequence of new snow and a strong to storm force northerly wind, sometimes large wind slabs will form during the night in particular on east, south and west facing slopes. The new snow and wind slabs of the last four days are lying on the unfavourable surface of an old snowpack especially on little used shady slopes above approximately 1800 m. Released avalanches and distinct weak layers deep in the old snowpack indicate a dangerous avalanche situation. Since Monday on very steep north, east and south facing slopes numerous small to medium-sized avalanches were reported.

Up to 60 cm of snow has fallen since Sunday above approximately 1800 m.

Above the tree line there are 60 to 90 cm of snow, and even more in some localities. At high altitude snow depths vary greatly, depending on the influence of the wind.

Tendency

Saturday: The avalanche danger will not decrease for the time being.
