Wind slab

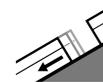

Snowpack stability: **poor**

Frequency: **some**

Avalanche size: **medium**

Wet snow

Gliding snow

Old wind slabs in particular on wind-protected shady slopes. Gliding avalanches and wet snow slides as the day progresses.

The somewhat older wind slabs can still be released in some cases in particular on wind-protected shady slopes and at intermediate and high altitudes. The avalanche prone locations are to be found especially in gullies and bowls, and behind abrupt changes in the terrain and in steep rocky terrain. Sometimes the avalanches are medium-sized.

As the day progresses the likelihood of gliding avalanches and wet snow slides being released will increase gradually on very steep sunny slopes in all altitude zones. Small and medium-sized natural avalanches are possible.

Backcountry touring and other off-piste activities call for meticulous route selection. Apart from the danger of being buried, restraint should be exercised as well in view of the danger of avalanches sweeping people along and giving rise to falls.

Snowpack

The wind slabs remain in some cases prone to triggering. They are lying on a crust.

Sunshine and high temperatures will give rise as the day progresses to increasing moistening of the snowpack especially on very steep sunny slopes.

There is more snow than usual. At intermediate altitudes there are 150 to 250 cm of snow, and even more in some localities.

Tendency

Wednesday: The weather will be warm. The avalanche danger will persist.
