Gliding snow

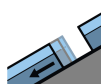

Wet snow

Gradual increase in danger of wet and gliding avalanches in the course of the day.

All aspects high Alpine regions: Wet snow slides and avalanches are possible as the day progresses, even medium-sized ones. Avalanches can be released by people or triggered naturally. In the afternoon as a consequence of the rain there will be an increase in the danger of moist avalanches. In addition an acute danger of gliding avalanches exists. Sometimes they are large.

Backcountry tours should be started and concluded very early. Areas with glide cracks are to be avoided.

Snowpack

The surface of the snowpack will only just freeze and will already soften in the late morning. The weather will be partly cloudy. Up to 2800 m rain will fall in the afternoon in some regions.

The snowpack will be generally wet all the way through. Shady slopes, intermediate altitudes: Several small and medium-sized moist slab avalanches have been released last week. Several medium-sized and large gliding avalanches have been released also on steep grassy slopes.

At intermediate and high altitudes a lot of snow is lying for the time of year.

Tendency

Monday: The conditions remain spring-like.
